

Email 02 – Email Header Analysis Report

Purpose

This report documents a preliminary review of the email header information visible in the supplied Gmail screenshot. It records the sender details and email-authentication results and distinguishes those observations from conclusions that would require checking the message body and destination URLs.

Preliminary classification: Potentially legitimate — further verification required

1. Sample details

Field	Observed value
From	Internshala
Recipient	Gmail recipient shown in the evidence screenshot
Subject	Update: Your Google AI Plus access is waiting to be claimed Confirm your 12-month access at no cost
Date shown	7 October 2026 at 19:20
SPF	PASS — the screenshot shows SPF passing for the displayed sending IP.
DKIM	PASS — the screenshot shows DKIM passing for mail.internshala.com.
DMARC	PASS — the screenshot shows DMARC passing.

2. Findings

Authentication results: SPF, DKIM, and DMARC are all shown as PASS in the screenshot. This is a positive signal that the message passed the displayed sender-domain authentication checks.

Sender and subject: The visible sender is Internshala at mail.internshala.com. The subject advertises Google AI Plus access at no cost for 12 months. The offer wording is a reason to inspect the full message and destination link carefully, but the subject alone does not establish that the email is malicious.

Evidence limits: The screenshot shows header information only. It does not establish whether the email body is consistent with a genuine campaign, whether links lead to official domains, or whether any attachments are safe.

3. Risk assessment

Based on the available evidence, the email should not be conclusively marked safe or phishing. Passing SPF, DKIM, and DMARC does not guarantee that the content is trustworthy; a legitimate service can also be abused or impersonated through lookalike links or misleading offers.

4. Recommended verification steps

- Inspect the full sender address and compare the domain with official Internshala communications.
- Hover over links or inspect their actual URLs without opening them; confirm that any offer is hosted on an official, expected domain.
- Check whether the message is expected and whether the offer is independently confirmed through the official service website or account.
- Do not enter passwords, payment details, or verification codes through a link unless the destination has been independently verified.
- If the link or offer cannot be verified, report the message as suspicious and avoid interacting with it.

5. Evidence screenshot

The screenshot below is embedded directly in this report as the evidence supplied for this analysis.

Original message

Message ID	<rplFqperStCbzmz48oouAQ@geopod-ismtpd-4>
Created on:	7 October 2026 at 19:20 (Delivered after 0 seconds)
From:	Internshala <student@mail.internshala.com>
To:	kartikchaudhary.np@gmail.com
Subject:	Update: Your Google AI Plus access is waiting to be claimed Confirm your 12-month access at no cost
SPF:	PASS with IP 159.183.101.179 Learn more
DKIM:	'PASS' with domain mail.internshala.com Learn more
DMARC:	'PASS' Learn more

6. Conclusion

The visible header results are consistent with the message passing SPF, DKIM, and DMARC checks. However, header authentication alone is insufficient to verify the email's content or links. Final classification: **Potentially legitimate — further verification required**, pending review of the message body and destination URLs.

Scope note: This report is based only on the supplied screenshot. No claim is made that the message body, links, or offer were independently validated.
